

## Lab2

171830635 俞星凯

实验目的	<div>1. 学习 socket 相关知识</div> <div>2. 通过学习 ip, icmp, arp 的报文格式来理解这些协议的功能和作用</div> <div>3. 掌握初步 raw sockt 编程基础</div>																								
数据结构说明	<div>1. 在 Linux 中，IP 报头格式数据结构（&lt;netinet/ip.h&gt;）定义如下：</div> <div>struct ip</div> <div>{</div> <div>#if __BYTE_ORDER == __LITTLE_ENDIAN</div> <div>unsigned int ip_hl:4; /* header length */</div> <div>unsigned int ip_v:4; /* version */</div> <div>#endif</div> <div>#if __BYTE_ORDER == __BIG_ENDIAN</div> <div>unsigned int ip_v:4; /* version */</div> <div>unsigned int ip_hl:4; /* header length */</div> <div>#endif</div> <div>u_int8_t ip_tos; /* type of service */</div> <div>u_short ip_len; /* total length */</div> <div>u_short ip_id; /* identification */</div> <div>u_short ip_off; /* fragment offset field */</div> <div>#define IP_RF 0x8000 /* reserved fragment flag */</div> <div>#define IP_DF 0x4000 /* dont fragment flag */</div> <div>#define IP_MF 0x2000 /* more fragments flag */</div> <div>#define IP_OFFMASK 0x1fff /* mask for fragmenting bits */</div> <div>u_int8_t ip_ttl; /* time to live */</div> <div>u_int8_t ip_p; /* protocol */</div> <div>u_short ip_sum; /* checksum */</div> <div>struct in_addr ip_src, ip_dst; /* source and dest address */</div> <div>};</div> <div><table><tr><td>版本号 VER</td><td>IP 报头长度 IHL</td><td>服务类型 TOS</td><td>数据报长度 TL</td></tr><tr><td colspan="2">报文标志 ID</td><td>报文标志 F</td><td>分段偏移量 FO</td></tr><tr><td>生存时间 TTL</td><td colspan="2">协议号 PORT</td><td>报头校验和</td></tr><tr><td colspan="4">源地址</td></tr><tr><td colspan="4">目标地址</td></tr><tr><td colspan="4">任选项和填充位</td></tr></table></div> <div>2. 在 Linux 中，ICMP_ECHO 和 ICMP_ECHOREPLY 数 据 结 构（&lt;netinet/ip_icmp.h&gt;）定义如下：</div> <div>struct icmp</div> <div>{</div> <div>u_int8_t icmp_type; /* type of message, see below */</div> <div>u_int8_t icmp_code; /* type sub code */</div>	版本号 VER	IP 报头长度 IHL	服务类型 TOS	数据报长度 TL	报文标志 ID		报文标志 F	分段偏移量 FO	生存时间 TTL	协议号 PORT		报头校验和	源地址				目标地址				任选项和填充位			
版本号 VER	IP 报头长度 IHL	服务类型 TOS	数据报长度 TL																						
报文标志 ID		报文标志 F	分段偏移量 FO																						
生存时间 TTL	协议号 PORT		报头校验和																						
源地址																									
目标地址																									
任选项和填充位																									

	<div>u_int16_t icmp_cksum; /* ones complement checksum of struct */</div> <div>struct ih_idseq /* echo datagram */</div> <div>{</div> <div>u_int16_t icd_id;</div> <div>u_int16_t icd_seq;</div> <div>} ih_idseq;</div> <div>}</div> <div><table><tr><td>类型 TYPE(8或0)</td><td>编码 CODE (没有使用)</td><td>校验和 CHECKSUM</td></tr><tr><td colspan="2">标志符 Identifier</td><td>顺序号 Sequence NO</td></tr></table></div>	类型 TYPE(8或0)	编码 CODE (没有使用)	校验和 CHECKSUM	标志符 Identifier		顺序号 Sequence NO
类型 TYPE(8或0)	编码 CODE (没有使用)	校验和 CHECKSUM					
标志符 Identifier		顺序号 Sequence NO					
程序设计的思路以 及运行流程	<div>1. raw_socket</div> <div>创建一个 raw socket，不断收包，显示包的 MAC 和 IP 地址，并根据包头类型域的值来显示包的类型。</div> <div>2. raw_socket_ping<div>注：括号内为本次程序的函数名</div></div> <div>(1) 根据参数是主机名还是 IP 地址进行不同设置</div> <div>(2) 创建一个 raw socket</div> <div>(3) 发送一个包(send_packet)，需要先对包头进行封装(pack)，其中检验和字段采用检验和算法(cal_cksum)。</div> <div>(4) 接收一个包(recv_packet)，然后再对包头进行解封(unpack)，计算 rtt(cal_internal)，输出相关信息。</div> <div>(5) 循环(3)(4)</div> <div>(6) 进行数据统计。</div>						
运行结果截图	<div>1. raw_socket</div> <div><div>MAC address: 00:0c:29:82:6c:74==&gt;00:0c:29:25:7f:51</div><div>IP:192.168.0.2==&gt; 192.168.1.2</div><div>Protocol:icmp</div><div>MAC address: 00:0c:29:25:7f:51==&gt;00:0c:29:82:6c:74</div><div>IP:192.168.1.2==&gt; 192.168.0.2</div><div>Protocol:icmp</div><div>MAC address: 00:0c:29:25:7f:51==&gt;00:0c:29:82:6c:74</div><div>IP:192.168.0.1==&gt; 192.168.0.2</div><div>Protocol:arp</div><div>MAC address: 00:0c:29:82:6c:74==&gt;00:0c:29:25:7f:51</div><div>IP:192.168.0.2==&gt; 192.168.0.1</div><div>Protocol:arp</div><div>MAC address: 00:00:00:00:00:00==&gt;00:00:00:00:00:00</div><div>IP:127.0.0.1==&gt; 127.0.0.1</div><div>Protocol:udp</div><div>MAC address: 00:00:00:00:00:00==&gt;00:00:00:00:00:00</div><div>IP:127.0.0.1==&gt; 127.0.0.1</div><div>Protocol:udp</div><div>MAC address: 00:00:00:00:00:00==&gt;00:00:00:00:00:00</div><div>IP:127.0.0.1==&gt; 127.0.0.1</div><div>Protocol:icmp</div><div>MAC address: 00:00:00:00:00:00==&gt;00:00:00:00:00:00</div><div>IP:127.0.0.1==&gt; 127.0.0.1</div><div>Protocol:icmp</div></div>						

	<p>2. raw_socket_ping</p> <pre> root@ubuntu:/home/user# ./raw_socket_ping 192.168.1.2 Ping 192.168.1.2(192.168.1.2): 56 bytes of data in ICMP packets. 64 bytes from 192.168.1.2: icmp_seq = 1    ttl = 63    rtt = 2.515ms 64 bytes from 192.168.1.2: icmp_seq = 2    ttl = 63    rtt = 1.894ms 64 bytes from 192.168.1.2: icmp_seq = 3    ttl = 63    rtt = 1.664ms 64 bytes from 192.168.1.2: icmp_seq = 4    ttl = 63    rtt = 1.583ms 64 bytes from 192.168.1.2: icmp_seq = 5    ttl = 63    rtt = 0.746ms 64 bytes from 192.168.1.2: icmp_seq = 6    ttl = 63    rtt = 2.925ms 64 bytes from 192.168.1.2: icmp_seq = 7    ttl = 63    rtt = 1.278ms 64 bytes from 192.168.1.2: icmp_seq = 8    ttl = 63    rtt = 1.056ms 64 bytes from 192.168.1.2: icmp_seq = 9    ttl = 63    rtt = 0.961ms 64 bytes from 192.168.1.2: icmp_seq = 10   ttl = 63    rtt = 2.854ms 64 bytes from 192.168.1.2: icmp_seq = 11   ttl = 63    rtt = 0.932ms 64 bytes from 192.168.1.2: icmp_seq = 12   ttl = 63    rtt = 1.784ms 64 bytes from 192.168.1.2: icmp_seq = 13   ttl = 63    rtt = 0.950ms 64 bytes from 192.168.1.2: icmp_seq = 14   ttl = 63    rtt = 4.721ms 64 bytes from 192.168.1.2: icmp_seq = 15   ttl = 63    rtt = 0.926ms 64 bytes from 192.168.1.2: icmp_seq = 16   ttl = 63    rtt = 1.308ms 64 bytes from 192.168.1.2: icmp_seq = 17   ttl = 63    rtt = 0.640ms 64 bytes from 192.168.1.2: icmp_seq = 18   ttl = 63    rtt = 1.702ms 64 bytes from 192.168.1.2: icmp_seq = 19   ttl = 63    rtt = 0.924ms 64 bytes from 192.168.1.2: icmp_seq = 20   ttl = 63    rtt = 0.790ms 64 bytes from 192.168.1.2: icmp_seq = 21   ttl = 63    rtt = 1.181ms 64 bytes from 192.168.1.2: icmp_seq = 22   ttl = 63    rtt = 1.179ms 64 bytes from 192.168.1.2: icmp_seq = 23   ttl = 63    rtt = 1.201ms 64 bytes from 192.168.1.2: icmp_seq = 24   ttl = 63    rtt = 1.013ms 64 bytes from 192.168.1.2: icmp_seq = 25   ttl = 63    rtt = 1.220ms 64 bytes from 192.168.1.2: icmp_seq = 26   ttl = 63    rtt = 1.361ms 64 bytes from 192.168.1.2: icmp_seq = 27   ttl = 63    rtt = 1.143ms 64 bytes from 192.168.1.2: icmp_seq = 28   ttl = 63    rtt = 0.955ms 64 bytes from 192.168.1.2: icmp_seq = 29   ttl = 63    rtt = 1.757ms 64 bytes from 192.168.1.2: icmp_seq = 30   ttl = 63    rtt = 1.185ms 64 bytes from 192.168.1.2: icmp_seq = 31   ttl = 63    rtt = 1.167ms 64 bytes from 192.168.1.2: icmp_seq = 32   ttl = 63    rtt = 0.971ms  --- 192.168.1.2 ping statistics --- 32 packets transmitted, 32 received, %0 packet loss </pre>
相关参考资料	<p>计算机网络实验教材 2.02(修订)</p> <p><a href="https://blog.csdn.net/xtank_nie/article/details/39215225">https://blog.csdn.net/xtank_nie/article/details/39215225</a></p>
对比样例程序	<p>参考了教材上的 raw_socket 样例程序，并对其略做修改使之支持 ARP 的识别。</p>
代码个人创新以及思考	<p>1. raw_socket</p> <p>根据 MAC 包的第 13 字节判断 IP 数据包还是 ARP 请求/应答。</p> <p>2. raw_socket_ping</p> <p>(1) 修改了计算 rtt 的算法，使之能够正确显示到小数点后三位。</p> <p>(2) 由于只需实现简易的 ping 程序，故简化了代码中的大量冗余语句。</p> <p>(3) 采用系统 ping 程序的格式进行输出。</p>
该程序的应用场景创新（非必须）	<p>在多跳网络中每一跳都显示一次，即可判断断路位置。</p>
